The invention provides immunoglobulin E (IgE) antagonists comprising one or more of the FeepsilonRI receptor-binding determinant sites of human lgE. The antagonists include IgE variants comprising an immunoglobulin template and binding determinant sequences (bds) CDbds, EFbds and the sequence shown in AAV42581. The CDbds (CD loop binding determinant sequence) are selected from the sequences shown in AAV42577 and the EFbds (EP loop binding determinant sequences shown in AAV42578-V42580. The variants are selected from sequences shown in AAV42578-V42580. The variants are useful in raising and screening anti-IgE antibodies, in the isolation and purification of FcepsilonRI receptor and in the treatment and prophylaxis of allergic
gammal CH region CH at the 3' end of the VH-J region by means of a Nhel site. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to tract or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoglobulin E variants as peptide antagonists useful for raising and screening anti-immunoglobulin E (IgE) antibodies, in the isolation and purification of FcepsilonRI receptor and in the treatment of allergic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the human immunoglobulin G1 Fc region, and was used in creating a B2LF2-immunoglobulin Fc fusion protein (BZLF2/Fc).

B2LF2 is a Epstein-Barr virus (EBV) protein. To create B2LF2/Fc, this sequence, the leader sequence of mouse interleukin-7 (IL-7) (see AAR87021), a Flag octapeptide (see AAR87022) and a flaxible linker (see AAR87024) are joined to the extracellular domain (residues 34 to 223) of the B2LF2 sequence (see AAR87020). The B2LF2/Fc fusion protein containing this sequence is referred to in claim 4. B2LF2 proteins are members of the C-type lectin family. The C-type lectin domain is found in type II membrane proteins. The B2LF2 protein is capable of binding the beta chain of a major histocompatibility complex (MHC) class II antigen. Fusion proteins with an oligomerising zipper domain (OZD), instead of an immunoglobulin Fc region, can also be created. B2LF2

proteins inhibit antigen-specific antibody formation, proliferation of blood monounclear cells and cytotoxic T cell responses. They also exhibit superantigen-like activity. The proteins can be used for treating or preventing autoimmune diseases such as myasthenia gravis, multiple sclerosis and systemic lupus erythematosus. Also, for treating organ or tissue transplant rejection and for treating or preventing allergy or asthma. They can be used for treating cancer and viral disease, especially EBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The fusion protein can be used to treat cancer or viral disease, as HVS14 inhibits antigen presentation, or acts as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Fusions between Fc and HYS13 (see also AAW02387), a viral homologue of IL-17, and between Fc and murine CILA8 (AAW02386) were used to identify cells that express the murine IL-17R. Selected murine thymoma EL4 cells were used as a source of murine IL-17R CDNA (AAT33800).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    complex class II beta chain, useful for treating, e.g. auto-immune diseases or transplant rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence was used in the preparation of a synthetic construct containing the Epstein-barr virus (EBV) BZLF2 protein, which is capable of binding a beta-chain of a major histocompatibility complex (MHC) class II antigen. The protein can be used to inhibit antigen-specific antibody formation, peripheral blood mononclear cell proliferation and cytocoxic T-cell responses, e.g. in the prevention or treatment of autoimmune diseases, transplant rejection, allergies or asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                               The present sequence represents a protein used to create fusion proteins with the Bpstein-Barr virus BZLF2 proteins of the invention. The BZLF2 protein is capable of binding to a beta chain of a class II major histocompatibility complex antigen to inhibit an antigen-specific response. BZLF2 is useful for inhibiting antigen-specific antibody formation, the proliferation of blood mononuclear mononuclear cells, and cytotoxic T cell responses. BZLF2 is also useful for inhibiting undesirable antigen specific responses, e.g. in the treatment or prevention of asthma; for preventing or treating autoimmune disease; and for preventing tissue or organ transplant rejection.

```
This sequence represents a human IgG1 Fc fragment which is used in the construction of a fusion protein with human interleukin-17 receptor [LI-178, LI-178 polypeptides have immunoregulatory activity. They can be used for inhibiting T cell proliferation, or for inhibiting T cell activation. In particular they can be used for preventing or treating organ or graft rejection, autoimmune disease, alleray or asthma. They can also be used for the prevention or treatment of inflammatory disease in proliferation or immunogalbulian secretion. The IL-17 polypeptides can also be used as immunogens, reagents in in vitro assays, or as binding agents for affinity purification procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                   Isolated interleukin-17 receptor DNA - used to develop products for treating e.g. organ or graft rejection, autoimmune disease, allergy, asthma or inflammatory disease

A novel interleukin-17 receptor (IL-17R) was identified by screening a CDNA library from T cell thymoma EL4 cells, which were identified as binding fusion proteins comprising human immunoslobulin GI (19G1) Fc region and soluble IL-17 (CTA-8) protein or a homologous Herpesvirus saimiri (HSV) protein, designated HSV13. Suppressing rejection of a grafted syngeneic or allogeneic organ or tissue in a graftecioient involves transfecting the organ or tissue to be transplanted with DNA encoding soluble IL-17R, so that expression of IL-17R by the engrafted organ or tissue results in suppression of rejection. Soluble IL-17R fragments comprise residues 1-320 of the murine IL-17R, residues 1-320 of the human IL-17R, and fragments of the extracellular domain that bind IL-17. The method is useful for regulating an immunoresponse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for suppressing rejection of grafted organs or tissues in the recipient and for treating or preventing diseases like allergy, asthma and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IL-17R; interleukin-17 receptor; soluble; CTLA-8; Herpesvirus saimiri; HSV13; graft rejection; suppressor; immunosuppressive; anti-allergic; anti-asthmatic; immunoglobulin G1; Fc region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ŏ
                                                                                                                                                                                                                                                                                                                                The present invention relates to a novel receptor that binds Interleukin (II-17, also known as CTLA-8) and a Herpesvirus saimiri homolog, HVS13. The receptor is a type I transmembrane protein which is referred to as IL-17R. Murine thymona EL4 cells were found to express a receptor for IL-17. An EL4 mammalian expression library was screened and cDNA encoding the receptor was identified (see AAA61238). The CDNA was used to isolate DNA encoding human IL-17R by cross species hybridisation. The human IL-17R cDNA and protein are described in that may be used with IL-17R cDNA and protein. Soluble forms of the receptor may be used to regulate immune responses, for example to suppress rejection of organ grafts. Antibodies to IL-17R consisting of amino acids 1-322 of murine IL-17R or research assays. Such antibodies

                                                                                               A novel interleukin-17 receptor (IL-17R) was identified by screening a binding fusion proteins comprising human immunoglobulin GI (19G1) Fc region and soluble IL-17 (CTLA-8) protein or a homologous Herpesvirus saimiri (HSV) protein, designated HSV13. Regulating an Harmone or inflammatory response in a mammal comprises administering soluble IL-17R. Soluble IL-17R fragments comprise residues 1-320 of the mum IL-17R, and fragments of the mum IL-17R, and fragments of the an immunoresponse, for treating or preventing diseases like allergy, asthma and autofimmune diseases, and for suppressing rejection of grafted organs or tissues in the recipient.

Tries Invention Frailes to an institute and putting interpervising standard to an institution (CTLAR) and a herpesvirus standing (TTLAR) as soluble [L-17 protein (CTLAR) and a herpesvirus standing protein comprising an immunoglobulin For region, and used to screen for the expression of the IL-17R. The screening identified the novel receptor of the invention. IL-17R is a type I transmembrane protein that exhibits antiinflammatory, immunosuppressive, antiasthmatic and antiallergic activities, and is an inhibitor of T cell proliferation and activation. IL-17R can be used to regulate immune functions, and is useful for preventing or treating organ or graft rejection, autoimmune disease, allergy or asthma. The present sequence represents the Fc region of human immunoglobulin G1 (1961). This fragment of IgG1 forms part of the IL-17 fusion protein used to identify IL-17R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention is directed towards assays for detection of interleukin-17 (IL-17), IL-17 receptor (IL-17R), and (antagonists or mimetics of) the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to Interleukin-17 receptors (IL-17R), Interleukin-17 and their corresponding nucleic acid molecules. IL-17R is a Type I transmembrane protein which is used for regulating the immune response. The invention is useful for suppressing rejection of a grafted organ or tissue in a graft recipient. Soluble IL-17 (CTLA-8) receptors are useful for preventing or treating organ or graft rejection,
interaction between IL-17 and IL-17R. The assay kit comprises an IL-17R
              protein and a detecting reagent. The method is useful for inhibiting binding of IL-17 to cells expressing IL-17R. IL-17 receptors are also useful for preventing or treating organ or graft rejection, autoimmune diseases, allergy, asthma and inflammatory diseases in which activated T-cells play an important role. The present sequence represents FC region of human immunoglobulin IgG1, used for constructing a murine

ö
autoimmune disease, allergy, asthma, and inflammatory disease in which activated T-cells play a role. Soluble IL-17 fusion proteins are used to screen cells for the expression of IL-17 receptor. Derivatives of IL-17R are also used as immunogens, reagents in in vitro assays, or as binding agents for affinity purification procedures.

gramma 4 chain constant region - pig (fragment)
C;Species: Sus scrofa domestica (domestic pig)
C;Species: Sus scrofa domestica (domestic pig)
C;Accession: 147162
R;Kacskovics, I.; Sun, J.; Butler, J.E.
A;Title: Five putative subclasses of swine igG identified from the cDNA sequences of A;Reference number: 147158; MUID:95015845
A;Reference number: 147158; MUID:95015845
A;Accession: 147162
A;Retais: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Retaidues: 1-277 < KAC>

```
The sequences given in AAR41707-09 are encoded by the expression vector pAH4655. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, also be used for diagnostic methods.
Antibody conjugates specific for transferrin receptor - used for diagnosis and treatment of cancer, AIDS and neurological

binding molecule of the invention. The recombinate binding molecule of the invention. The recombinate binding molecule of the invention. The recombinate binding molecule of binding a target molecule without triggering complement comprises: (a) a binding domain capable of binding a target molecule; and dependent lysis, or the cell-indidated binding a target molecule; and comparises: (a) a binding domain capable of binding a target molecule (especially FegammaRID completion of a human immunoglobulin G (IgG) heavy chain. The binding mannequolulin G (IgG) heavy chain. The binding molecule can be used to prevent or inhibit the binding of a second binding molecule, e.g. an antibody, to the target molecule. The binding molecule is useful for the treatment of graft-vs-host disease, organ transplant rejection, bone-marrow transplant rejection, autoimmunity (e.g. vasculitis, autoimmunity molecule is vasculitis, autoimmunity can around and architis), alloimmunity ceg. foetal/neonatal alloimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN chrobiastosis foetalis), Goodpastures, sickle cell anaemia and coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FegammaR and desirable con-tuman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent con-tumen amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent con-tument and allowed thromboty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

produce Fc region-containing by the state of the section of the produce Fc region-containing by the section of the section of the variant polypeptides that have altered effector. The fc region of the variant polypeptides that have acid modifications in the Fc region. The variant polypeptides are useful for treating and LFA-1-mediated disorders. Where the polypeptide binds the HER2 and LFA-1-mediated disorders. Where the polypeptide binds the HER2 creeptor, the disorder preferably is HER2-expression of the HER2 center. Such cancers include breast cancer, squamous cell cancer, small-cell lung cancer, normal cell lung cancer, plioblastoma, cervical cancer, varian cancer, bladder cancer, hepatoma, colon cancer, colorectal cancer, hepatoma, colon cancer, colorectal cancer, liver cancer, liver cancer, liver cancer, hepatoms, vulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck cancer.
                                                                                New Fc region-containing polypeptides that have altered effector function due to one or more amino acid modifications in the Fc region, useful in the treatment of cancer and allergic conditions such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2 appvagpsvflfppkpkdtlmisrtpevtcvvvdvshedpevqfnwyvdgvevhnaktkp 61

This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides represented in ABM56550 - AAB76420 and AAB76432 - AAB76509 are examples of the ErbB2 binding ligands of the invention. Sequences AAB76421 - AAB76431 represent antibody Fc amino acid sequences used in the isolation of the peptides of the invention. The peptides compete for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional deficiency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve deafness; Meniere's disease; diabetic neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy -
functions to target hybrid molecule to target cell, and immunoglobulin constant region multimerization domain
                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                               1 APPVAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKP 60
                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a fusion protein, comprising a peptide ligand and an immunoglobulin (Tg) constant region multimerization domain (Ib). The hybrid molecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For example the peptide ligand can bind ErbB2. The peptide ligand may bind to and inhibit the activity associated with a particular

The present sequence is human immunoglobulin G2 (IgG2) constant region mature protein. 19G2 forms a fusion protein with human erythropoietin (EPO). EPO has improved biological activity and an extended serum half life greater than 20 hours. The present invention relates to modified EPO forms such as fusion proteins comprising a FC portion of an immunoglobulin (Ig) molecule and an EPO molecule (FC-EPO). The FC portion is fused covalently through its C-terminus directly or indirectly to the modified or mutated. The invention also relates to non-fused EPO molecules which have a pattern of cysteines or disulphide bonding which
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                     disorders characterized by over expression of HER2/Erbb2 such as cancers, diseases of the nervous system, musculature and epithelia, e.g. nervous system damage resulting from trauma, surgery, strokes, ischaemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In particular the synthetic peptide ligands may be used to treat Alzheimer's disease, parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and neuropathy associated with diabetes.
ErbB2 with naturally occurring ligands, and may be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to vaccine compositions comprising a vaccine and a timed-release formulation of a cytokine or cytokine/immunoglobulin fusion protein or plasmid. The formulation or device releases the cytokine protein or plasmid at one or more temporal points subsequent to vaccine administration. The vaccines can be used for treating an autoimmune disease, an infectious disease, an inflammatory disease, a neoplastic disease, or an immunologic disease in an individual. The vaccines can be used to elicit immune responses against diseases such as AIDS, malaria, tuberculosis, hepatitis C, hepatitis B, cancer or influenza. The methods
is distinct from human or animal EPO. Pharmaceutical compositions containing EPO are useful in the treatment of EPO deficient diseases such as amaemia, renal failure, HIV infection, blood loss and chronic disease that can be treated with haematopoietic growth factor.

It was produced by expresion of the coding mutagenised CDNA (produced as described in AAQ28089) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a homodimer, enabling high recovery and purification from the medium of cells expressing it. It possesses increased serum half-life and has increased avidity for HIV cf. heavy chain dimers. It can inhibit HIV infection of
an provide for enhancement of one or more immunologic parameters such a antibody response, a cellular proliferative response as well as ytotoxic T-lymphocyte levels. In addition the Ig can increase the inculating half life of the cytokine. The present sequence represents human interleukin-2 (IL-2)/Ig fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the human CD4-gamma 2 chimeric heavy chain homodimer amino acid sequence. The invention relates to an immunoconjugate comprising a cytotoxic radionuclide and a heterotetramer of two heavy chains and two light chains. The cytotoxic radionuclide is linked to either the heavy chains or the light chains, or to all four chains, directly or through a bifunctional chelator. Both heavy chains are chimeric CD4-Iq (immunoglobulin) G2 chains encoded by vector CD4-ig(immunoglobulin) G2 chains encoded by vector CD4-kappa chains encoded by vector CD4-kappa chains encoded by vector CD4-kLC-PRCCMV (ATCC 75193) and both light chains are chimeric CD4-kappa chains encoded by vector CD4-kLC-PRCCMV (ATCC 75194). CD4 is a non-polymorphic cell surface glycoprotein that is expressed on the

                                                                                                                                                                                        Human CD4-gamma 2 chimeric heavy chain homodimer amino acid sequence.
                                                                                                                                                   Gaps
infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject.

surface of helper T lymphocytes, cells of the monocyte/macrophage lineage and dendritic cells. CD4 associates with major histocompatibility complex (MHC) class II molecules on the surface of antigen presenting cells to mediate efficient cellular immune response interactions. In humans CD4 is the target of interaction with the human immunodeficiency virus HIV. The immunoconjugate is used to kill cells infected with HIV, and for treating or preventing infection. It is also used for imaging HIV-infected tissues (for staging or prognosis of infection, and for assessing efficacy of treatments). The immunoconjugate is also used to determine the HIV envelope glycoprotein burden, once determined, this information is used in the staging and prognosis of HIV infected patients. The immunoconjugate should be active against all strains of HIV (since the immunoconjugate should be active against all strains of HIV (since the immunoconjugate should be active against all strains of HIV (since the immunoconjugate intracellularly and secreted efficiently from mammalian calls, allowing high recovery and purification from the culture medium. They have longer half-life in serum and greater avidity than heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for inhibiting infection of a

chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4: 1962 = immunoglobulin gamma 2). CD4 is a cell surface of ylycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has two heavy and two light chains which are encoded by expression vectors CD4-IGG2HC-PRCCW(VI) and CD4-LCC-PRCCW(V(2), respectively. The method is used to inhibit infection of a CD4-cell by a HIV and to prevent CD4-cells of a subject from becoming infected with HIV. The method is also useful for treating a subject having CD4-cells infected with HIV. The present sequence is human fusion protein: CD4-gamma2 chimeric heavy chain homodimer. This sequence was used in the method of the present invention. ö CD4+ cell by HIV. The method comprises contacting the HIV with a CD4-IgG2 Gaps 1 APPVAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKP 60 radionuclide linked to heterotetramer Immunoconjugate for treating human immunodeficiency virus-infected ö subject, consists of cytotoxic radionuclide linked to heterotet comprising two chimeric CD4-IgG2 heavy chains and two chimeric CD4-kappalight chains Length 432; Indels CD4-gamma2 chimeric heavy chain homodimer protien. The present invention relates to an immunoconjugate, comprising a cytotoxic radionuclide linked, directly or via a bifunctional chelator, to a heterotetramer having two chimeric CD4-1gG2 heavy chains encoded by an expression vector CD4-1gG2HC-pRcCMV and two chimeric CD4-kappa light chains encoded by an expression vector

This invention relates to a combination of an anti-Ep-CAM (cyclic adenosine monophosphate) antibody with a chemotherapeutic agent, that is capable of arresting Ep-CAM antigen expressing cells in the synthesis (S) phase or the second growth phase (M) of cell enlargement (G2)/DNA replication. The antibody exhibits cytostatic activity and is useful in the manufacture of a medicament for use in anti-cancer therapy, characterised in that a chemotherapeutic agent, which is capable of arresting Ep-CAM antigen expressing cells in S or in G2/M, is arresting Ep-CAM antigen expressing cells in S or in G2/M, is co-administered to a patient with an anti-Ep-CAM antibody. The combination is useful for treating cancer, particularly colorectal cancer, breast cancer, gastric cancer, prostate cancer or non-small-cell ung acancer. The present sequence represents the heavy chain of anti-Ep-CAM antibody known as humanised 323/A3 (IgG2cys) which can be used in the combination of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     isotype 2 (1962, C-gamma-2). C-gamma-1 (see AAY31669) and C-gamma-3 (see AAY31671) bind For Ecceptors with high affinity, whereas C-gamma-4 (see AAY31671) has 10-fold lower binding affinity and C-gamma-2 does not bind to For Ecceptor gamma. The invention provides methods for the genetic construction and expression of antibody-based fusion proteins with enhanced circulating half-lives. The fusion proteins lack the ability to bind to immunoglobulin FC receptors, either as a consequence of the antibody isotype used for protein construction, i.e. a C-gamma-2 constant region (FC) or c-gamma-4 Fc receptor, or through directed mutagenesis of antibody isotypes that normally bind Fc receptors, i.e. C-gamma-1.

or C-gamma-3. The methods can be used for to increase the correction such as a non-immunoglobulin (Ig) protein such as circhiating half-life of a non-immunoglobulin (Ig) protein such as a lymphotoxin or a colony stimulating factor, a

and light chain sequences, useful
                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a heavy chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1. CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disperses, disbetes and graft rejection) and proliferative disorders dispease, diabetes and up-regulate immune system to up-regulate immune system to up-regulate immunodeficient disorders.

IG gamma-3 heavy chain disease proteins - human
C; Species: Homo sapiens (man)
C; Species: Homo sapiens (man)
C; Species: Homo sapiens (man)
C; Species: Homo sapiens
C; Date: 31-Dec-1979 #sequence_revision 23-Oct-1981 #text_change 16-Jul-1999
C; Accession: A90442; A92219; A90198; A93915; A02149
R; Frangione, B.; Rosenwasser, E.; Preili, F.; Franklin, E.C.
Biochemistry 19, 4304-4308, 1980
A; Title: Primary structure of human gamma3 immunoglobulin deletion mutant: gamma3 hea
A; Reference number: A90442; MUID:81021548
A; Contents: heavy chain disease protein Wis
A; Contents: heavy chain disease protein Wis
A; Contents: heavy chain disease protein Wis
A; Reference number: A90442
A; Note: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interch
A; Note: the molecule is a dimer linked by 12 disulfide bonds; it has an extra interch
A; Note: the sequence of residues 42-76 was taken from the reference that follows
A; Michaelsen, T. E.; Frangione, B.; Franklin, E.C.
A; Michaelsen, T. E.; Frangione, B.; Franklin, E.C.
A; Title: Primary structure of the 'hinge' region of human IgG3. Probable quadruplicat
A; Reference number: A92219; MUID:77118561
A; Reference number: A92219; MuiD:77118561
A; Contents: normal gamma-3 chains, sequence corresponding to residues 12-97 of protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Accession: A90198
A; Molecule type: protein
A; Nolecule type: protein
A; Note: this protein lacks most of the V region, all of the CH1 region, and part of t

C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Superfamily: immunoglobulin c region; immunoglobulin homology C; Superfamily: immunoglobulin homology city. Sp9-110/Region: immunoglobulin homology city. F; 20-85/Domain: immunoglobulin homology city. F; 240-307/Domain: immuno
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              19 ganma-2 chain C region - human

C.Accession: C.30554
A.Tamunool. 142, 708-711, 1989
A.Title: Isolation and sequence of sheep Ig H and L chain cDNA.
A.Reference number: A.30554; MUID:89093962
A.Recession: C.30554
A.Status: pre-liminary; not compared with conceptual translation
A.Molecule type: mRNA
A.Residues: 1-308 <-FOLD.
C.Superfamily: immunoglobulin C region; immunoglobulin homology
C.Superfamily: immunoglobulin homology <-IMM>
F.113-182/Domain: immunoglobulin homology <-IMM>

Reference number: A99354; MUID:77068474
A. Contents: annotation; disulfide bonds
A. Note: Cys-16 is involved in a heavy-light chain bond
A. Note: Cys-105, Cys-107, and Cys-110 form inter-heavy chain bonds
C. Comment: This chain was isolated from pooled serum of strain 13 inbred guinea pigs.
C. Complex: An immunoglobulin heterotetramer subunit consists of two identical light (k. hain disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into C. Superfamily: immunoglobulin c region; immunoglobulin homology
C. Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin
F:21-81/Domain: immunoglobulin homology x.M1>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                 1 APELLGGPSVFLFPPKPKDT......CKVSNKALPAPIEKTISKTK 110
